

DESCRIPTION

## SULFOXYALKYLTHIOPHENE AND PROCESS FOR PRODUCING THE SAME

5

[0001]

TECHNICAL FIELD

The present invention relates to a monomer for a  
 $\pi$ -conjugated conducting polymer and, more particularly, to  
10 sulfoxyalkylthiophene and a process for production thereof.

[0002]

BACKGROUND ART

There have been known many species of  $\pi$ -conjugated  
15 conducting polymer having sulfonic acid groups. One of them  
is polythiophene capable of self-doping, which is commonly  
applied to electron beam lithography. (See Non-Patent  
Documents 1 and 2.)

In addition, among known species of water-soluble  
20 self-doping polythiophene for antistatic use are  
poly(3-thiophene- $\beta$ -butanesulfonate) and  
poly(3-thiophene- $\beta$ -ethanesulfonate), (See Non-Patent  
Documents 1 and 3.)

However, nothing has been reported about the  
25 sulfoxyalkylthiophene disclosed in the present invention.

[0003]

Incidentally, among known species of  
hydroxyalkynylthiophene is  
3-[4-(3-hydroxy-prop-1-ynyl)-thiophen-3-yl]-prop-2-yn-1-ol  
30 (3,4HTPO), which is represented by formula [7] below. (See  
Patent Document 1.)

### DISCLOSURE OF INVENTION

#### Problems to be Solved by the Invention

[0006]

15 It is an object of the present invention to provide a  
new species of sulfoxyalkylthiophene as a monomer capable of  
oxidative polymerization to give a  $\pi$ -conjugated conducting  
polymer. It is another object of the present invention to  
provide a process for production of said compound.

20

#### Means for Solving the Problems

[0007]

In order to achieve the above-mentioned object, the  
present inventor carried out a series of researches which led  
25 to the finding that a species of alkylthiophene represented  
by the formula [1] or [2] below is a monomer capable of  
oxidative polymerization to give a  $\pi$ -conjugated conducting  
polymer. The present invention was completed on the basis of  
this finding.

30 [0008]

The present invention covers any of the following.

(1) 3,4-bis(1-sulfoxyalkyl)thiophene represented by formula  
[1] below.

[1]

(where R denotes a hydrogen atom, alkali metal atom, or alkaline earth metal atom, and n denotes an integer of 1 to 3.)

(2) 3,4-bis(1-hydroxyalkyl)thiophene represented by formula  
5 [2] below.

(where n denotes an integer of 1 to 3.)

(3) 3,4-bis(1-sulfoxypropyl-3-yl)thiophene represented by formula [3] below.

(where R denotes a hydrogen atom, alkali metal atom, or alkaline earth metal atom.)

(4) 3,4-bis(1-hydroxypropyl-3-yl)thiophene represented by formula [4] below.

(5) Sulfoxyalkynylthiophene defined in (1) or (3) above wherein the alkali metal atom is sodium or potassium.

(6) A process which comprises steps of reacting  
3,4-bis(1-hydroxyalkyl)thiophene represented by formula [2]  
20 below

(where n denotes an integer of 1 to 3.)

with a sulfur trioxide compound to give  
3,4-bis(1-sulfoxyalkyl)thiophene represented by the formula  
[5] below.

5 (where n is defined as above.)

and reacting it with an alkali metal compound or  
alkaline earth metal compound to give a metal salt of  
3,4-bis(1-sulfoxyalkyl)thiophene represented by formula [6]  
below.

10

(where M denotes alkali metal atom or alkaline metal atom,  
and n is defined as above.)

(7) A process which comprises a step of reducing  
3-[4-(3-hydroxy-prop-1-ynyl)-thiophen-3-yl]-prop-2-yn-1-ol  
15 (3,4-HTPO for short hereinafter) represented by formula [7]  
below

to give 3,4-bis(1-hydroxy-propyl-3-yl)thiophene  
(3,4-BHT for short hereinafter) represented by formula [4]  
20 below.

(8) The process for producing a metal salt of  
sulfoxyalkynylthiophene as defined in (6) above, wherein the  
alkali metal atom is sodium or potassium.

(9) The process for producing a metal salt of sulfoxyalkynylthiophene as defined in (6) above, wherein the sulfur trioxide compound is sulfur trioxide, sulfur trioxide·1,4-dioxane complex, sulfur trioxide·DMF (N,N-dimethylformamide) complex, or sulfur trioxide·pyridine complex.

[0009]

#### EFFECT OF THE INVENTION

10 The present invention provides a new species of sulfoxyalkylthiophene as a monomer capable of oxidative polymerization to give a  $\pi$ -conjugated conducting polymer.

[0010]

#### 15 BEST MODE FOR CARRYING OUT THE INVENTION

A detailed description of the present invention will be given below.

Formula [1] that represents the compound according to the present invention has an integer of 1 to 3 for n; however, 20 the value of n should preferably be 1. In this case, formula [1] is equivalent to formula [3].

Formula [2] that represents the compound according to the present invention has an integer of 1 to 3 for n; however, the value of n should preferably be 1. In this case, formula 25 [2] is equivalent to formula [4].

Formula [6] that represents a metal salt of sulfoxyalkynylthiophene has an integer of 1 to 3 for n; however, the value of n should preferably be 1.

[0011]

30 The following description is based on the assumption that the foregoing formulas [1], [2], [5], and [6] have an integer of 1 for n. The compound according to the present invention is produced by the reaction shown by the following schemes.

[0012]

[0013]

5 [0014]

(In the third scheme above, M denotes an alkali metal atom or alkaline earth metal atom, and Y denotes a residue.)

[0015]

10 The foregoing three schemes will be described sequentially.

The starting material (3,4-HTPO) is produced by the reaction which is represented by the following schemes mentioned in WO Publication No. 01/19809.

15 [0016]

(where X is defined as above.)

[0017]

The starting material, or 3,4-dihalogenothiophene (3,4-DXT) includes 3,4-difluorothiophene, 3,4-dichlorothiophene, 3,4-dibromothiophene, and 3,4-diiodothiophene, with the third one being preferable from the standpoint of reactivity and economy. The second starting material, or propargyl alcohol may be a commercial one.

[0018]

The reaction uses a catalyst, which is a combination of  $\text{Pd}(\text{Ph}_3\text{P})_4$  (2+1 mol%) and  $\text{CuI}$  (3+1.5 mol%), and a solvent, which is n-propylamine. After heating with refluxing, the reaction product is purified by silica gel column chromatography. Thus there is obtained 3,4-HTPO as desired.

Incidentally, although WO Publication No. 01/19809 mentions nothing about the intermediate product or 3,4-XTPO, the present inventors found that the reaction product contains 3-(4-halogeno-thiophen-3-yl)-prop-2-yn-1-ol (3,4-XTPO) in addition to 3,4-HTPO. This intermediate product was separated and analyzed by purifying the reaction product by silica gel column chromatography.

[0019]

The first step of the reaction is reduction of 3,4-HTPO (represented by formula [7] above) into 3,4-BHT (represented by formula [4] above). This reduction reaction is accomplished by any known process for conversion of the triple bond into the single bond. Some examples of the process include (1) reduction by a metal or metal salt, (2) reduction by a metal hydride, (3) reduction by a metal hydride complex, (4) reduction by diborane and substituted borane, (5) reduction by hydrazine, (6) reduction by diimide, (7) reduction by a phosphorus compound, (8) electrolytic reduction, and (9) catalytic reduction.

[0020]

Of these processes, catalytic reduction is most practical. The catalytic reduction used in the present invention is as follows. The catalyst metal is selected from

palladium, ruthenium, rhodium, platinum, nickel, cobalt, and iron (which belong to Group 8 of the periodic table) and copper (which belongs to Group 1 of the periodic table).

They may be used alone or in combination with other elements.

- 5 They may be used in the form of metal, Raney catalyst, or complex, or they may be supported on a carrier such as diatomaceous earth, alumina, zeolite, and carbon.

[0021]

Typical examples of the catalyst include

- 10 palladium-carbon, ruthenium-carbon, rhodium-carbon, platinum-carbon, palladium-alumina, ruthenium-alumina, rhodium-alumina, platinum-alumina, reduced nickel, reduced cobalt, Raney nickel, Raney cobalt, Raney copper, copper oxide, copper chromate,
- 15 chlorotris(triphenylphosphine)rhodium, chlorohydridetris(triphenylphosphine)ruthenium, dichlorotris(triphenylphosphine)ruthenium, and hydridecarbonayl(triphenylphosphine)iridium. Of these examples, palladium-carbon and ruthenium-carbon are most
- 20 desirable.

[0022]

- The amount of the catalyst (in terms of 5% supported catalyst) should preferably be 0.1 to 30 wt% (particularly 0.5 to 20 wt%) for the starting material. The solvent may be
- 25 selected from alcohols (such as methanol, ethanol, and propanol), ethers (such as dioxane, tetrahydrofuran, and dimethoxyethane), and esters (such as ethyl acetate and propyl acetate).

- The amount of the solvent should preferably be 1 to 50
- 30 times by weight, particularly 3 to 10 times by weight, the amount of the raw material. The pressure of hydrogen should preferably be in the range of normal pressure to 10 MPa (100 kg/cm<sup>2</sup>), particularly from normal pressure to 5 MPa (50 kg/cm<sup>2</sup>). The reaction temperature should preferably be in
- 35 the range of 0 to 180° C, particularly 10 to 150° C.

[0023]

It is possible to trace the reaction by determining the amount of hydrogen absorbed. The theoretical amount of hydrogen absorption can be determined by analyzing the sample by gas chromatography after hydrogen absorption. The reaction may be accomplished batchwise or continuously. The reaction may be followed by removal of catalyst by filtration, concentration, and purification by recrystallization or column chromatography.

The next step of reaction is sulfonation of 3,4-BHT into 3,4-BST. The sulfonating agent for this step is sulfur trioxide compound, which includes not only sulfur trioxide proper but also complex of sulfur trioxide with N,N-dimethylformamide (DMF), 1,4-dioxane, or pyridine. The amount of the sulfonating agent is 1 to 1.5 mol equivalent for the amount of hydroxyl groups in the raw material.

[0024]

The solvent may be selected from amide compounds, such as N,N-dimethylformamide (DMF), N,N-dimethylacetamide (DMAc), N-methylpyrrolidone (NMP), and 1,3-dimethyl-2-imidazolidinone (DMI), and ether compounds, such as tetrahydrofuran (THF), 1,2-dimethoxyethane, and 1,4-dioxane. Of these solvents, DMF and DMAc are preferable. The amount of the solvent should preferably be 1 to 10 times by weight (particularly 2 to 5 times by weight) the amount of the starting material.

[0025]

The reaction temperature should preferably be 0 to 150°C, particularly 10 to 100°C. The reaction time should preferably be 1 to 5 hours; it may be determined from the result of analysis of the reaction liquid by liquid chromatography.

After the reaction is complete, the reaction liquid is distilled for concentration and solvent removal. The residue is dissolved in acetone with heating, and the resulting solution is held to stand at room temperature for crystallization. The crystals are filtered off and dried. Thus there is obtained 3,4-bis(1-sulfoxypropyl)thiophene (3,4-BST) as the desired product.

[0026]

The scheme (3) is intended to react 3,4-BST with a metal compound to give a metal salt of sulfoxypropylthiophene. This reaction proceeds in the following manner.

5       The metal compound includes alkali metal compounds and alkaline earth metal compounds, such as hydroxides, carbonates, and organic salts of lithium, sodium, potassium, rubidium, cesium, magnesium, calcium, strontium, and barium.

10       Their typical examples are sodium hydroxide, potassium hydroxide, magnesium hydroxide, calcium hydroxide, sodium carbonate, potassium carbonate, magnesium carbonate, calcium carbonate, sodium hydrogen carbonate, potassium hydrogen carbonate, magnesium hydrogen carbonate, calcium hydrogen carbonate, sodium formate, potassium formate, magnesium  
15       formate, calcium formate, sodium acetate, potassium acetate, magnesium acetate, and calcium acetate.

[0027]

20       Of these metal compounds, preferable ones are sodium hydroxide, potassium hydroxide, magnesium hydroxide, calcium hydroxide, sodium carbonate, potassium carbonate, magnesium carbonate, calcium carbonate, sodium hydrogen carbonate, and potassium hydrogen carbonate.

25       The amount of the metal compound should preferably be 1 to 2 mol equivalent, particularly 1 to 1.5 mol equivalent, for the amount of sulfonic groups in the starting material.

30       The solvent includes not only water (which dissolves the raw material and the metal compound) but also imide compounds, such as N,N-dimethylformamide (DMF), N,N-dimethylacetamide (DMAC), N-methylpyrrolidone, and 1,3-dimethyl-2-imidazolidinone (DMI), which may be used alone or in combination with water. The amount of the solvent should preferably be 1 to 10 times by weight, particularly 2 to 5 times by weight, the amount of the starting material.

[0028]

35       The reaction temperature should preferably be -20 to 50°C, particularly 0 to 40°C. The reaction time should preferably be 0.5 to 5 hours; it may be determined from the

result of analysis of the reaction liquid by liquid chromatography.

After the reaction is complete, the reaction liquid is distilled for concentration and solvent removal. The residue is dissolved in methanol to remove the excess metal compound. After concentration, the residue is dissolved in ethanol and the resulting solution is allowed to stand for crystallization. Thus there is obtained a metal salt of 3,4-bis(1-sulfoxyalkyl)thiophene (3,4-BSST if the metal is sodium).

Incidentally, the reaction solution obtained by sulfonation according to the scheme (2) may be used as such for the reaction with the metal salt according to the scheme (3).

The above-mentioned reaction and purification may be accomplished batchwise or continuously and under atmospheric pressure or adequate pressure.

[0029]

#### EXAMPLES

The invention will be described in more detail with reference to the following Examples, which are not intended to restrict the scope thereof. Incidentally, the analytical methods employed in the examples are listed below.

[0030]

(1) Gas chromatography (GC)

Instrument: Shimadzu GC-17A

Column: capillary column, CBP1-W25-100 (25 m × 0.53 mmφ × 1 μm)

Column temperature: 100°C (hold for 2 min), 8°C/min (rate of temperature rise), 290°C (hold for 10 min).

Injection temperature: 290°C

Detector temperature: 290°C

Carrier gas: helium

Method for detection: by FID

(2) Mass spectrometry (MASS)

Instrument: LX-1000 (JEOL Ltd.)

Method for detection: by FAB

(3)  $^1\text{H}$  NMR

5 Instrument: INOVA 500 (VARIAN Corp.)

Solvent:  $\text{CDCl}_3$

Standard reference material: tetramethylsilane (TMS)

(4)  $^{13}\text{C}$  NMR

Instrument: INOVA 500 (VARIAN Corp.)

10 Solvent:  $\text{CDCl}_3$

Standard reference material:  $\text{CDCl}_3$  ( $\delta$ : 77.1 ppm)

(5) Melting point (mp.)

Instrument: MP-J3 (from Kiki Yanako)

(6) Liquid chromatography (LC)

15 Instrument: Shimadzu LC-10A

Column: YMC-Pack ODS-AM (S-5  $\mu\text{m}$ , 120A, AM-303,

AM12S05-2546WT) (250 mm  $\times$  4.6 mm $\phi$ )

Column temperature: 40 $^\circ\text{C}$

Detector wavelength: UV 230 nm

20 Eluent:  $\text{H}_2\text{O}/\text{CH}_3\text{CN}$  = 1/2,

Flow rate: 0.5 mL/min

[0031]

Referential Example 1

25 [0032]

A 300-mL four-neck flask was charged with 25.0 g (103 mmol) of 3,4-dibromothiophene (3,4-DBT) and 100 g of n-propylamine. With stirring at 25 $^\circ\text{C}$ , the flask was further charged with 2.38 g (2.06 mmol) of tetrakis(triphenyl)phosphine palladium and 0.588 g (3.09 mmol) of copper iodide. The flask was charged 17.3 g (309 mmol) of propargyl alcohol by drops over 10 minutes. Stirring was continued for 1 hour at 25 $^\circ\text{C}$  and then for 7 hours at 54 $^\circ\text{C}$  in an oil bath at 70 $^\circ\text{C}$ .

The flask was further charged with 1.19 g (1.03 mmol) of tetrakis(triphenyl)phosphine palladium and 0.29 g (1.10 mmol) of copper iodide. The flask was given 8.7 g (155 mmol) of propargyl alcohol dropwise. The reactants were stirred  
5 for 20 hours at 57°C in an oil bath at 70°C.  
[0033]

After the reaction was complete, the reaction liquid was concentrated and the residue was dissolved in ethyl acetate and water. Insoluble matter was removed by  
10 filtration with the help of Celite. The organic layer was separated and concentrated to give 37.5 g of oily substance. The oily substance was analyzed by gas chromatography. The result of analysis gave a new peak A (40.8 area%) and a new peak B (23.3 area%). The oily substance was purified by  
15 column chromatography with 140 g of silica gel (eluent : ethyl acetate/n-heptane = 1:9 - 1:5). There was obtained 16.0 g of oily substance (as fraction 1), with 70.6% purity, in a 57% yield. There was also obtained 4.56 g of oily substance (as fraction 2), with 76.5% purity, in a 23.7%  
20 yield.  
[0034]

The thus obtained oily substance (as fraction 1) with 70.6% purity in an amount of 16.0 g was further purified by column chromatography with 140 g of silica gel (eluent :  
25 ethyl acetate/n-heptane = 1:9 - 1:5). There was obtained 10.3 g of oily substance (as fraction 6), with 93.0% purity, in 84.7% recovery. This oily substance was identified as 3-(4-bromothiophen-3-yl)-prop-2-yn-1-ol (3,4-BTPO) by the following analytical data.

30 <sup>1</sup>H NMR (CDCl<sub>3</sub>, δ ppm): 4.43 (s, 2H), 7.13 (d, J=3.36 Hz, 1H),  
7.36 (d, J=3.67 Hz, 1H)  
<sup>13</sup>C NMR (CDCl<sub>3</sub>, δ ppm): 51.2564, 78.5646, 90.6355, 113.3275,  
123.8113, 122.9033, 127.1915.

[0035]

35 On the other hand, the oily substance (as fraction 2) with 76.5% purity in an amount of 4.56 g was purified again by column chromatography with 40 g of silica gel (eluent :

[0038]

MASS ( $E1^+$ ,  $m/e(\%)$ ): 200( $M^+$ , 19), 182(14), 156(40),  
111(100).

$^1H$  NMR ( $DMSO-d_6$ ,  $\delta$  ppm): 1.69-1.75 (m, 4H), 2.51 (t,  $J=7.84$   
Hz, 4H), 3.42-3.48 (m, 4H), 4.51 (t,  $J=5.00$  Hz, 2H), 7.05 (s, 2H).

$^{13}C$  NMR ( $DMSO-d_6$ ,  $\delta$  ppm): 24.6925, 32.5363, 60.3863, 120.2828,  
141.3420 (2 each).

mp.: 45-46° C

[0039]

Example 2

[0040]

A 50-mL four-neck glass flask was charged with 2.00 g  
(10.0 mmol) of 3,4-bis(1-hydroxypropyl-3-yl)thiophene  
(3,4-BHT) and 10 g of N,N-dimethylformamide (DMF). With  
stirring at 10° C, the flask was further charged with 3.18 g  
(20.0 mmol) of sulfur trioxide-pyridine complex in several  
portions. The temperature of the reactant was gradually  
raised to 20° C. After stirring for 1 hour, the reaction  
product was analyzed by liquid chromatography. The result of  
LC gave a new peak, with the peak of 3,4-BHT (as the starting  
material) disappeared.

The reaction product was concentrated under reduced  
pressure. The resulting concentrate was dissolved in acetone  
with heating, and the resulting solution was allowed to stand  
overnight at 15° C. A gummy solid product separated out.  
This product was collected by filtration and then dried.  
Thus, there was obtained 5.01 g of gummy product. This  
product was identified as 3,4-bis(1-sulfoxypropyl-3-yl)thiophene·dipyridine salt (3,4-BST·2Py) by the following  
analytical data.

of white crystals (in a 82.2% yield). The result of LC gave a single peak. This product was identified as 3,4-bis(1-sodium sulfoxypropyl-3-yl)thiophene (3,4-BSST) by the following analytical data.

5 [0044]

MASS (FAB<sup>-</sup>, m/e(%)): 403([M-H]<sup>-</sup>, 3), 381(100), 359(9),  
279(25), 97(53).

<sup>1</sup>H NMR (DMSO-d<sub>6</sub>, δ ppm): 1.79 (t, J=7.64 Hz, 4H), 2.48-2.51  
(m, 4H), 3.75 (t, J=6.57 Hz, 4H),  
10 7.09 (s, 2H).

<sup>13</sup>C NMR (DMSO-d<sub>6</sub>, δ ppm): 24.5069, 29.0774, 65.1374, 120.6161,  
140.7825 (2 each for above).

mp.: 215-216°C

[0045]

15 As mentioned above, the present invention provides a new monomer capable of oxidative polymerization to give a useful  $\pi$ -conjugated conducting polymer.
